# »» TRANSIT WAREHOUSE

The transit warehouse allows you to either automatically or manually control the input and output of goods from the transit warehouse. The module is perfectly integrated with the other BeOne Suite modules which facilitates inputting and outputting of goods (either partially or completely) from the warehouse. Thanks to dedicated functions integrated within the module, it will be possible to produce printouts of all input and output movements.

## INPUTS/OUTPUTS/ INVENTORIES MANAGEMENT

With BeOne's WMS module, the inputs and outputs from the transit warehouse are managed through appropriate transactions connected to the TMS modules, or manually. The inventory balances regarding each individual input of the transit warehouse are also managed.

## INVENTORY SITUATION

BeOne's WMS enables the control of the entire inventory situation through various indicators: airport, port, nation, line, client, warehouse and location.

## PACKAGE LABELS

The production and management of package labels regarding entry in the warehouse can take place through the module itself or can be acquired with package label numbering already produced by the senders and correspondents.

## EVENTS

BeOne's WMS offers the option of entering events concerning the entry. Some of these events can be assigned amounts, reiterated where appropriate in the billing of the shipments that will originate from the warehouse outputs.

## COSTS

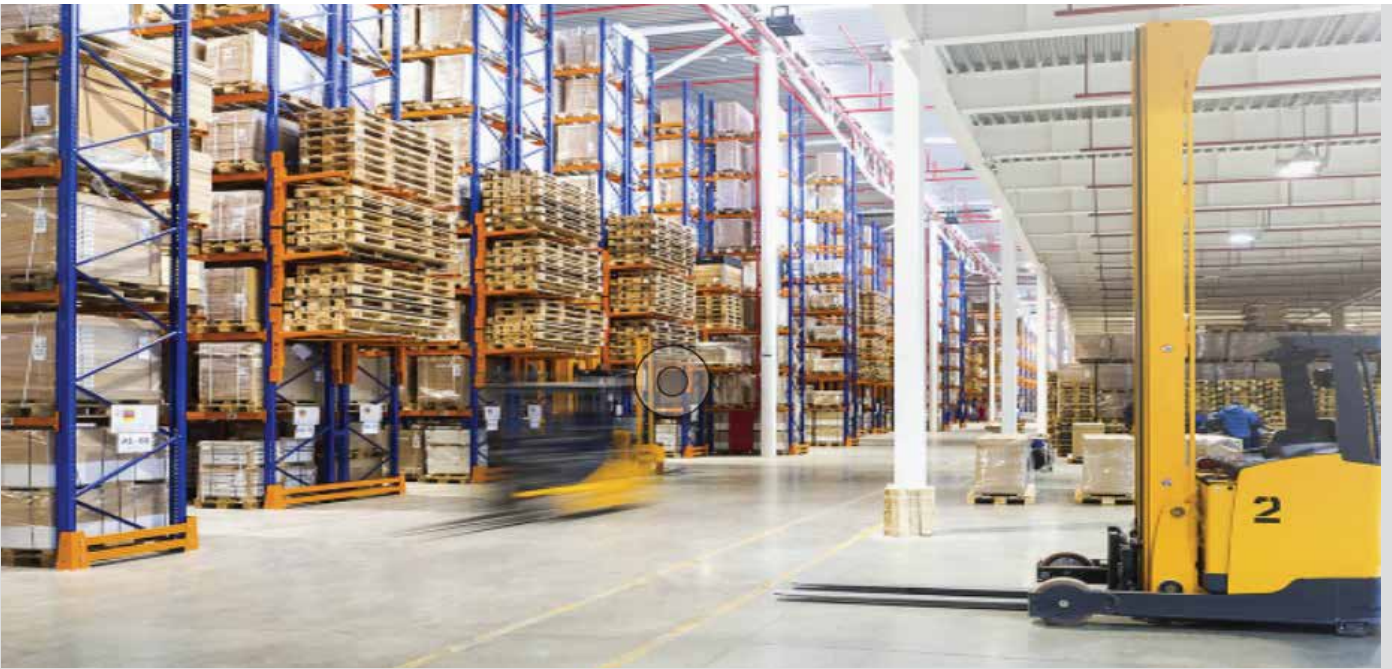

One of the options of WMS concerns the insertion of the costs regarding entry. These costs can be reiterated where appropriate in the management of the shipment costs, which will originate from the warehouse outputs.

## DOCUMENTS ISSUED

BeOne's WMS allows the following documents to be produced:

- input from the transit warehouse
- output from the transit warehouse
- package labels.

## WMS - WAREHOUSE MANAGEMENT SYSTEM

# EVERYTHING UNDER CONTROL

The “short-term storage” of the goods is managed in the transit warehouse. BeOne’s WMS makes it possible to control the transit warehouse activity of incoming and outgoing goods. Goods may come into the warehouse from pick-ups management or with manual loads, for the subsequent shipment, or from the Import operational modules for subsequent deliveries. Outgoing goods can allow the management of even partial deliveries of the packages.

## ADVANTAGES

### INTEGRATION

- User configurable solution
- WMS directly linked to TMS
- Production activities Management

### TIME

- Complete Warehouse Management
- Control of the operational process
- Short-term storage

### ECONOMIC SAVING

- Paths and Goods Optimization
- Management of all transactions
- Increased productivity
