COMMON  
BUSINESS  
APPLICATIONS

## Common Business Application

### Effective information, assured business

BeOne's Common Business Applications enables relations with clients and potential clients to be coordinated in an organised way through CRM and Business Intelligence (BeOne Analytics) to be managed.

CRM stores the information and makes it available for obtaining spot offers as required. The planning and implementation of appropriate strategies regarding the client become the determining factors: CRM is a tool that enables the management to promote client loyalty, with the acquisition of new market slices, improve the interaction between the company's department, boost productivity and aid commercial activity.

Among the various functions of Nova Systems' solution, BeOne Analytics stands out as the module in the Suite that enables the user to manage Business Intelligence. BeOne Analytics is the data collection system that analyses the phenomena, causes of problems and performance obtained to assess the progress of the company, the branches and the traffic. The collected data are appropriately processed and used to give solid support – on the basis of the previous and current data – to the decisions of those who occupy management roles (in order to understand the trend in the corporate performance, generate provisional estimates and predict possible future scenarios and response strategies).

The information may be published in different levels of detail and hierarchy for any other corporate department: marketing, sales, financial, personnel or others.

Through BeOne Analytics, a series of dashboards are provided that enable the data on traffic and shipments to be analysed. These functions also available on smartphones and tablets.

CRM: Sales Force Automation	
<b>Prospect and Acquired Customer Management</b>	Management of a single data archive, with the possibility of differentiating prospect customers from those acquired, and with the ability to change of status from prospect to acquired
